#### Positive maps as entanglement witnesses

#### Definition

A positive definite matrix  $Z \in B(K \otimes H)$  is called entangled if it is not separable

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ● ●

#### Definition

A positive definite matrix  $Z \in B(K \otimes H)$  is called entangled if it is not separable

► *Z* is entangled if and only if there is  $\phi \in \mathfrak{P}$  such that  $\langle Z, \phi \rangle_d < 0$ . We say that such  $\phi$  is an entanglement witness for *Z*

#### Merging of positive maps

Let  $K_1, K_2, H_1, H_2$  be Hilbert spaces and

 $\phi_1: B(K_1) \to B(H_1), \qquad \phi_2: B(K_2) \to B(H_2)$ 

be positive maps.

Let  $K_3 = H_3 = \mathbb{C}$ , and consider spaces

$$K = K_1 \oplus K_2 \oplus K_3, \qquad H = H_1 \oplus H_2 \oplus H_3$$

Each element  $X \in B(K)$  can be represented in the matrix form

$$X = \begin{pmatrix} X_{11} & X_{12} & X_{13} \\ \overline{X_{21}} & \overline{X_{22}} & \overline{X_{23}} \\ \overline{X_{31}} & \overline{X_{32}} & \overline{X_{33}} \end{pmatrix}$$

where  $X_{ij} \in B(K_j, K_i)$ . In particular

 $X_{i3} \in B(\mathbb{C},K_i) = K_i, \qquad X_{3j} \in B(K_j,\mathbb{C}) = K_j^*, \qquad X_{33} \in \mathbb{C}.$ 

Consider a  $\phi$  :  $B(K) \rightarrow B(H)$  given by

$$\phi(X) = \begin{pmatrix} \phi_1(X_{11}) + \omega_2(X_{22})P_1 & 0 & B_1X_{13} + C_1X_{31}^t \\ 0 & \phi_2(X_{22}) + \omega_1(X_{11})P_2 & B_2X_{23} + C_2X_{31}^t \\ 0 & X_{31}B_1^{\bar{*}} + X_{13}^{\bar{t}}C_1^{\bar{*}} & X_{32}B_2^{\bar{*}} + X_{23}^{\bar{t}}C_2^{\bar{*}} & X_{33}^{\bar{t}} \end{pmatrix}$$

where

- ►  $B_i, C_i : K_i \rightarrow H_i$ , i = 1, 2, linear operators
- $\omega_i : B(K_i) \to \mathbb{C}, \quad i = 1, 2, \text{ positive functionals}$
- ▶  $P_i \in B(H_i)$ , i = 1, 2, projection onto the range of  $\phi_i(\mathbb{I}_{B(K_i)})$

#### Definition

We say that the map  $\phi$  is a merging of  $\phi_1$ ,  $\phi_2$  by means of ingredients  $B_i$ ,  $C_i$ ,  $\omega_i$ .

**Question:** Is a merging of positive maps  $\phi_1$  and  $\phi_2$  positive?

**Question:** Is a merging of positive maps  $\phi_1$  and  $\phi_2$  positive?

**Question:** Is a merging of positive maps  $\phi_1$  and  $\phi_2$  positive? Let  $\eta_i \in K_i$ ,  $y_i \in H_i$ . Define

$$\mu_{i}(\eta_{i}, y_{i}) = \sqrt{\langle y_{i}, \phi_{i}(\eta_{i}\eta_{i}^{*})y_{i} \rangle} \qquad \varepsilon_{i}(\eta_{i}, y_{i}) = |\langle y_{i}, B_{i}\eta_{i} \rangle| + |\langle y_{i}, C_{i}\overline{\eta_{i}} \rangle|$$
  
$$\delta_{i}(\eta_{i}, y_{i}) = \sqrt{\mu_{i}(\eta_{i}, y_{i})^{2} - \varepsilon_{i}(\eta_{i}, y_{i})^{2}} \qquad \sigma_{i}(\eta_{i}, y_{i'}) = \sqrt{\omega_{i}(\eta_{i}\eta_{i}^{*})} \|P_{i'}y_{i'}\|$$

#### Theorem

The merging  $\phi$  of positive maps  $\phi_1$ ,  $\phi_2$  by means of  $B_i$ ,  $C_i$ ,  $\omega_i$  is a positive map if and only if the following conditions are satisfied

- (i)  $\varepsilon_i(\eta_i, y_i) \le \mu_i(\eta_i, y_i)$  for  $i = 1, 2, \eta_i \in K_i, y_i \in H_i$ ,
- (*ii*) for every  $\eta_1 \in K_1$ ,  $\eta_2 \in K_2$ ,  $y_1 \in H_1$ ,  $y_2 \in H_2$ ,

 $\delta_1(\eta_1, y_1) \delta_2(\eta_2, y_2) + \sigma_1(\eta_1, y_2) \sigma_2(\eta_2, y_1) \ge \varepsilon_1(\eta_1, y_1) \varepsilon_2(\eta_2, y_2)$

#### Corollary

If the merging of positive maps  $\phi_1$ ,  $\phi_2$  by means of  $B_i$ ,  $C_i$ ,  $\omega_i$  is positive, then  $\psi_i + \chi_i \le \phi_i$  for i = 1, 2.

### **Properties of merging**

 $\phi_i: B(K_i) \to B(H_i), \quad B_i, C_i: K_i \to H_i, \quad i = 1, 2$ 

Define  $\psi_i : B(K_i) \to B(H_i)$  and  $\chi_i : B(K_i) \to B(H_i)$  by

$$\psi_i(X) = B_i X B_i^*, \qquad \chi_i(X) = C_i X^t C_i^*, \qquad X \in B(K_i).$$

#### Corollary

If the merging of positive maps  $\phi_1$ ,  $\phi_2$  by means of  $B_i$ ,  $C_i$ ,  $\omega_i$  is positive, then  $\psi_i + \chi_i \le \phi_i$  for i = 1, 2.

No notrivial merging of two extremal nondecomposable maps produces a positive map. Therefore, in order to get some nontrivial positive map by the merging procedure one should consider maps  $\phi_1$  and  $\phi_2$  with some 'regularity' properties. However, for properly chosen 'regular' maps there is a possibility for nontrivial merging. Surprisingly, merging of 'regular' maps can produce highly 'nonregular' positive maps. Theorem

If  $\phi_1$  is 2-positive and  $\phi_2$  is 2-copositive, then there are operators  $B_i$ ,  $C_i$  and functionals  $\omega_i$  such that merging of  $\phi_1$  and  $\phi_2$  by means of  $C_i$ ,  $D_i$ ,  $\omega_i$  is a positive nondecomposable map.

Corollary

Consequently, for each pair of positive maps satisfying assumptions of the above theorem, there is a merging which is an entanglement witness for some PPT state

・ロト・一部・・ヨト・ヨト ヨー うらつ

# $3 \times 3$ example of PPT entagled state

By considering EW from the previous slide we obtain the following example of (unnormalized) PPT entangled matrix

where  $\gamma > 0$ ,  $b_1, c_1 \in \mathbb{C}$ ,

$$s_i = \max\{|b_i|, |c_i|\}, \quad s = \max\{\sqrt{|b_1|^2 + |b_2|^2}, \sqrt{|c_1|^2 + |c_2|^2}\}$$

### **Exposed positive maps**

Theorem (M,Rutkowski)

For  $A_i: K_i \to H_i$ , i = 1, 2, the map  $\phi_{A_1, A_2}: B(K_1 \oplus K_2 \oplus \mathbb{C}) \to B(H_1 \oplus H_2 \oplus \mathbb{C})$  given by

$$X \mapsto \begin{pmatrix} A_1 X_{11} A_1^* + \operatorname{Tr}(A_2 X_{22}^t A_2^*) E_1 & 0 & A_1 X_{13} \\ \hline 0 & A_2 X_{22}^t A_2^* + \operatorname{Tr}(A_1 X_{11} A_1^*) E_2 & A_2 X_{32}^t \\ \hline 0 & X_{31} A_1^* & X_{23}^t A_2^* & X_{23}^t A_2^* \\ \hline X_{23}^t A_2^t & X_{33}^t \end{pmatrix}$$

is exposed in the cone of positive maps.

#### Remark

Strong spanning property was shown by Chruscinski and Sarbicki to be a useful sufficient condition for exposedness. Note, that  $\phi_{A_1,A_2}$ does not satisfy this property for general choice of  $A_1, A_2$ .

A positive map  $\phi$  :  $B(K) \rightarrow B(H)$  is called optimal if there is no CP map  $\psi$  such that  $\psi \leq \phi$ .

A positive map  $\phi : B(K) \to B(H)$  is called optimal if there is no CP map  $\psi$  such that  $\psi \le \phi$ . Equivalently: The face Face( $\phi$ ) does not contain CP maps.

A positive map  $\phi$  :  $B(K) \rightarrow B(H)$  is called optimal if there is no CP map  $\psi$  such that  $\psi \leq \phi$ . Equivalently: The face Face( $\phi$ ) does not contain CP maps.

Spanning property: There are vectors  $\eta_k \in K$  and  $y_k \in H$ , k = 1, ..., N, such that

(ロ)

- $\langle y_k, \phi(\eta_k \eta_k^*) y_k \rangle = 0$  for  $k = 1, \dots, N$ ,
- span{ $\eta_k \otimes y_k : k = 1, ..., N$ } =  $K \otimes H$ .
